

Practice	Definition	Rationale	Questions
<b>Planning</b>	Discussing and representing problems visually before attempting to solve them.	Students are often inclined to start coding without a clear plan in mind. It's important to pause and plan before jumping in.	<ul style="list-style-type: none"> <li>• What is the problem you're trying to solve?</li> <li>• What have you done so far (if anything)?</li> <li>• Would it help to read the instructions or to draw a picture?</li> </ul>
<b>Decomposition</b>	Breaking down complex tasks into smaller, more manageable pieces.	Large tasks often seem insurmountable at first. The key is to break them down and build and test solutions incrementally.	<ul style="list-style-type: none"> <li>• Can the overall task be broken into smaller pieces?</li> <li>• What's the first piece you could build and test?</li> <li>• What will come second, third, fourth, etc.?</li> </ul>
<b>Prediction</b>	Formulating and articulating expectations for how a program will work.	Every time students run their code, they should have a hypothesis about what will happen.	<ul style="list-style-type: none"> <li>• What do you expect your code to do?</li> <li>• How will you know if your code is working (or not)?</li> <li>• If it doesn't work, what will you try next?</li> </ul>
<b>Observation</b>	Carefully watching to see how a program actually performs.	To see whether code is working, students need to observe carefully, keeping test conditions as consistent as possible.	<ul style="list-style-type: none"> <li>• What do you see happening when the code runs?</li> <li>• How does what you see differ from what you want?</li> <li>• Are your testing conditions identical every time?</li> </ul>
<b>Debugging</b>	Identifying and resolving problems (i.e. "bugs") in a computer program.	A program rarely works perfectly the first time. Coding is an iterative process of testing, debugging, and refinement.	<ul style="list-style-type: none"> <li>• Where in your program does the problem occur?</li> <li>• Can different sections be tested in isolation?</li> <li>• What could you change to create more evidence?</li> </ul>
<b>Abstraction</b>	Noticing similarities among pieces of a program or computing challenge.	Often, a first attempt to complete a computing task will reveal patterns that can be used to simplify the code.	<ul style="list-style-type: none"> <li>• Does this program contain repeating patterns?</li> <li>• Do any sprites or objects behave in similar ways?</li> <li>• Could loops or functions be used to simplify the code?</li> </ul>
<b>Collaboration</b>	Working and communicating with others to solve problems.	Coding is not a solitary pursuit. It's important for students to be able to work with others, and discuss problems and solutions.	<ul style="list-style-type: none"> <li>• How can you divide responsibilities efficiently?</li> <li>• How would you explain your code to a classmate?</li> <li>• What is a challenge you encountered and overcame in this project?</li> </ul>
